TITLE: Palmitoyl ethanolamide in mammalian tissues [This paper was presented during the Twelfth Pharmacologic Days, Smolenice, 27 Jan 65.]

SOURCE: Ceskoslovenska fysiologie, v. 14, no. 4, 1965, 287

TOPIC TAGS: experiment animal, rat, radioisotope, tracer study, brain, liver, biosynthesis, gas chromatography, amine, biochemistry

ABSTRACT: Palmitoyl ethanolamide, an endogenous substance known to have anti-inflammatory and antianaphylactic properties, was detected by gas chromatography in the brain (30 g/Gm of tissue), liver (7 g/Gm), skeletal muscles (1 g) of rats and guinea pigs; C^{14} palmitic acid, C^{14} ethanolamine study confirmed the in vitro synthesis as well as previously unreported pharmacologic roles. Raised at the Shimleul Sil'vaneyey State Farm.

Orig Pub: Gradina, vai si livada, 1956, 5, No 9, 49-51.

Abstract: Of 24 peach varieties, the most sensitive to frosts proved to be the Miller Cling, Alberta, Hindenburg, "Khale" varieties. The more frost resistant proved to be the "Invingetorul" and the common peach (*Persica vulgaris* Mill.) varieties. Frost resistance of the peach depends on a compound of factors. In 35-year-old trees (Ford variety), 95-98% of the flowering buds and the 2-3 year old branches were

ORG: Scientific-Research Institute of Radiophysics, Gor'kiy University (Nauchno-issledovatel'skiy radiofizicheskiy institut pri Gor'kovskom universitete)

TITLE: Experimental investigation of large-space-charge trochoidal beams shaped in electric and magnetic crossed fields

SOURCE: IVUZ. Radiofizika, v. 9, no. 1, 1966, 135-145

TOPIC TAGS: electron tube, trochoidal beam, cross field tube

ABSTRACT: Field and potential variations in the interaction space caused by a trochoidal beam were determined by a method involving a thin ribbon-type probing beam (D. L. Reverdin. J. Appl. Physics, 1951, 22, 257). The experimental tube was so designed that the driving parameter was $f = 9$; the tube had a 2-mm wide ribbon Ta cathode coated with LaB₆. Maximum current was 25-30 ma; velocity spread in the beam was kept within 4%. Distribution of the electric-field strength and potential in the anode-cathode gap was determined by the above experimental method

Card 1/2

UDC: 621.385.001 2

L 20652-66

ACC NR: AP6007637

(curves supplied). It was found that: (1) The electric-field strength at beam boundaries varies linearly with the current; with stronger magnetic fields, the electric-field-strength curve becomes steeper (with $H = 420$ oe and beam current $i = 20$ ma, the field strength above the beam was larger by 33% than with $i = 0$); (2) The anode-cathode potential and the beam kinetic energy decrease when the space charge appears; with high current values, the potential difference between the lower beam boundary and the cathode plate approaches zero; (3) Beam position in the inter-electrode space depends on current; with heavier currents, the beam center moves toward the anode. Orig. art. has: 6 figures and 3 formulas. [03]

Abstract: This paper was submitted to the First Symposium of
Socialist Countries in Sofia, 25 to 27 September 1962. It con-
tains a review of fundamental facts on the health service and
pharmacy in the European socialist countries, including the
Soviet Union, and some comparative data on the situation in the
USA. Types of pharmacies in the Soviet Union are described.

490. *The clinical and morphological picture of radiation injuries following application of radioactive phosphorus to the skin of rats (Russian text) MELNICHENKO A. V. and ZHOGA N. A. Vraz. Delo 1956, 10 (1019-1022)*

Eighteen rats were subjected to the application of radioactive P to the body (total area 230-260 sq.cm., strength from 13,000 to 20,000 r.e.p. per hour; duration of action 2-5 hr.). The animals were sacrificed and examined after various intervals of time. On the 3rd day the rats showed dryness of the upper respiratory tract, conjunctivitis, rhinitis; on the 8-10th day the animals became aggressive, excited, easily frightened and showed some loss of appetite. Diarrhoea appeared on the 21st day. Loss of weight began from the 4th day. Changes characteristic of radiation effects were seen in the skin, blood, haemopoietic organs, lymph nodes and blood vessels. Thus local application of non-deeply penetrating β -radiation produces manifestations of general radiation reaction as the result of neuro-humoral effect from the skin. Small amounts of radioactive P could be found in the blood, spleen, liver and bones. It may be supposed that it is absorbed through the skin. It may also be inhaled during irradiation, and may gain access inside as the result of the animals licking the fur in those places where the applicator had been attached. The authors ascribe the basic role in the pathogenesis of radiation illness to the ionization of the integuments.

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 22, 1966, 102-103

TOPIC TAGS: flow meter, flow measurement, flow, flow analysis

ABSTRACT: An Author Certificate has been issued for a mass flowmeter consisting of two engine-driven straight-blade vanes, a stream-guide device with spring-loaded blades, and a signaling unit. To increase the instrument's measurement range and reduce its power requirements and weight, the stream-guide device is equipped with a group of blades consisting of elastic plates located in the output portions of the flat blades, with one end hinged and the other end spring-loaded. AUTHOR DAVYDOV, A.S., MEL'NICHENKO, D.M.
TITLE On the Second Approximation in the Problem of the Scattering of Slow Neutrons By Coupled Protons
(O vtorom priblizhenii v zadache rasseyaniya medlennykh neytronov svyazannymi protonami. Russian)
PERIODICAL Zhurnal Eksperim. i. Teoret. Fiziki, 1957, Vol 32, Nr 4, pp 941 - 943 (U.S.S.R.)
ABSTRACT First of all the paper under review refers to some relevant previously published papers. Then it proceeds to investigate the convergence of the second approximation in the problem of the scattering of a slow ($E \sim 0$) neutron by a proton situated in the formation of a molecule of the mass M . First of all, the paper under review puts down a formula for the scattering matrix T_{ba} for neutrons of the energy zero, - the accuracy of this formula includes the second approximation. In the theory devised by Schwinger-Lippmann, the second approximation diverges at the consideration of the scattering of a neutron by a harmonically bound proton. The author of the paper points out a bringing about of convergence which, in his opinion, is not justified from a mathematical point of view. But the above-mentioned second approximation converges always then, when the wave functions of the real molecules (instead of the wave functions of idealized systems) are used. In a real molecule the high excited states correspond to the decaying system. The corresponding expression is written in its explicit form in the paper under review. Even if the energy

AUTHOR: Mel'nichenko, D.Ye. (D.Yu.) 21-5-19/26

TITLE: A New Profile of a Vacuum Spillway Dam (Novyy profil' vakuumnoy plotiny)

PERIODICAL: Dopovidi Akademii Nauk Ukrain's'koi RSR, 1957, Nr 5, pp. 502-504 (USSR)

ABSTRACT: The author has carried on studies on various profiles of spillway dams in the hydraulic laboratory of the Ukrainian Agricultural Academy. As a result, two profiles were designed, Nr 3 and Nr 4, which possess the best discharge capacities (coefficient of spillway discharge) and vacuum coefficients (the ratio of the vacuum value to the pressure at the spillway top). In addition to these two profiles, the profile of Krieger-Offitserov and the profile of Rebock were investigated. In comparison with the latter, the profile Nr 4 has a disadvantage which consists in an unfavorable distribution of the vacuum zone at the top of the spillway dam. This drawback can be eliminated by means of antivacuum pipes which connect the vacuum zone with the upper water. Using this method with profile Nr 4, one can reach the vacuum coefficient as low as 0.3 and the discharge coefficient as high as 0.565. These results can be used in designing more rational profiles for the

TITLE: The Laboratory of a Vuz Helps Production (Laboratoriya vuz
pomogayet proizvodstvu)

PERIODICAL: Vestnik Vysshey Shkoly, 1958, # 1, pp 51-52 (USSR)

ABSTRACT: The Laboratory of Hydraulics of the Ukrainian Agricultural Academy (Ukrainskaya sel'skokhozyaystvennaya akademiya) in co-operation with the Ukrainian branch of "Giprosel'elektro" has for a number of years participated in examining the profiles of vacuum dams of hydroelectric plants which are designed or being built.

As is known, the use of vacuum profiles enables to increase substantially the dams' passing capacity and to reduce considerably the size of the stone-work as compared with the profile of the Kriger-Ofitserov non-vacuum dam. However, the dam's vacuum should not be extensive as it is accompanied by the phenomena of cavitation and corrosion of the spillway's surface, the scale of which is directly dependent on the size of the vacuum. The development of more rational vacuum profiles of spillway dams with a small vacuum is of considerable scientific and practical importance, and the Laboratory's present aim. As a result of more than 500 examinations of

Card 1/3

The Laboratory of a Vuz Helps Production

3-1-15/32

spillway dams with various profiles 2 optimum profiles on the passing capacity (coefficient m of the spillway's consumption) and on the coefficient of vacuum were found out.

The virtues of both profiles, selected by the Laboratory, as compared with the existing vacuum profiles of the Rebok dam and the Kriger-Ofitserov non-vacuum dam are as follows: One of the profiles, having an equal cross section with the profile of Rebok, yields a higher coefficient in the spillway's consumption $m = 0.565$ and 0.558 (39, 48 and 39.06 liter/sec) and the vacuum coefficient is twice as small $\sigma = 0.66$ and 1.326 where $\sigma = \frac{h_{vac}}{H_0}$ (relationship of the size of the vacuum h_{vac} is the pressure to the crest of the dam H).

Still better results are obtained from the second profile (the consumption coefficient increases up to 0.582 and the vacuum coefficient decreases to 0.3). The second profile has also proved its technical preferences. It was introduced in the Ladyzhinka GES dam, and the Ukrainian branch of "Giprosel'-elektro" achieved an economy in concrete of 26% in pouring the body of the dam. Besides this, the large passing capacity of

Card 2/3

The Laboratory of a Vuz Helps Production

3-1-15/32

this profile made it possible to shorten the dam's length by 10 linear meters. The application of this profile yields also a considerable economy in cost.

Using the technical data received from "Giprosel'elektro", the dotsents M.V.Lavrent'yev and A.V.Gorelkin have prepared new training aids for the students.
